

# WHY DO WE CHOOSE *stainless steel?*

## Compatibility

Whilst the majority of Stonearth taps and shower products are compatible, care should be taken on product selection in terms of sizes and suitable water pressure prior to ordering to avoid installation issues. Suitable minimum water pressure for all taps and shower products have been indicated in the product information.

## Safety and Water Quality

Stainless steel is free from heavy metals like lead, nickel and tin – making it toxic free and safer for the whole family.

Many taps on the market contain toxic elements that leach into the household water supply, and pose a serious health hazard. This is why stainless steel is so widely used in the food industry.

## It simply looks better than chrome!

The Stonearth range of toxic-free stainless steel taps, showers and bathroom accessories have been picked by our designer as the matt finish and the tactile feel of the stainless taps really complement our designs. They're the perfect finishing touch!

## Durability

Stainless steel is resistant to acid, alkali and corrosion, and because it is solid throughout the natural stain resistance and corrosion resistant properties will last and last.

Taps that have plating rely on a coating which will deteriorate or chip over time – these taps and accessories don't even come close to stainless steel's usage life of over 50 years!

## No Peeling Coating

Unlike other taps on the market which are coated with a thin layer of chrome and nickel, our stainless steel taps are solid stainless steel throughout, so there is no coating to damage and their quality sheen will not be compromised.

Our Stainless steel taps are naturally stain resistant, and there are no pores or cracks to harbor dirt, grime or bacteria neither.
